

DATASETS: Development of a real-time testbed for renewable energy integration studies

MATLAB Live script code:

- 1) Automatically determines an RPP's continuously operating voltage and frequency boundaries as given in South African grid code requirements, from where it is imported to the simulation testbed.
- 2) Automatically determines an RPP's High Voltage Ride Through/Low Voltage Ride Through boundaries as given in South African grid codes, from where it is imported to the simulation testbed.

```
clear all
